SPECIFICATION

Attorney Docket No. 10778.00017

TO ALL WHOM IT MAY CONCERN:

Be it known that **John W. von Holdt, Jr.**, a citizen of the United States and a resident of Glenview, Illinois, has invented certain new and useful improvements in a

PLASTIC CONTAINER AND LID CONSTRUCTION

of which the following is a specification.

CROSS REFERENCE TO RELATED APPLICATION

This application is a divisional application based on Serial No. 09/925,246 filed August 8, 2001 entitled "Plastic Container and Lid Construction" which is a continuation application of Serial No. 09/492,199 filed January 27, 2000 entitled "Plastic Container and Lid Construction" which are incorporated by reference and for which priority is claimed.

BACKGROUND OF THE INVENTION

The present invention relates to a molded plastic container or bucket and a compatible lid

wherein the lid is removably secured to the open end of the container.

Many designs of molded plastic buckets or containers are known, for example, as

disclosed in the following patents of John W. Von Holdt, Sr.: Patent Nos. 4,375,948; 4,574,974;

4,512,494; 4,512,493; 4,452,382; 4,380,305; 4,308,970; and 4,210,258. Buckets or containers

for food, paint, solvents and chemicals have been made from molded plastic materials in accord

with the teachings of such patents. However, molded plastic buckets may lack the strength of

buckets fabricated from metal. Thus special designs for plastic buckets may be adopted to

obtain, for example, desired structural integrity, hoop strength and stacking strength. Hoop

strength relates to the function or characteristic of the container to resist lateral deformation or

change in the cross sectional shape of the container when lateral forces act upon the sides of the

container. Stacking strength relates to the function or characteristic of the container to support

vertical loads such as those which may occur when containers are stacked upon each other.

Also the design of the mouth or open end of a plastic bucket or container and a

compatible lid presents a challenge to provide a lid that is properly retained and sealed on the

open top of the bucket. Von Holdt in U.S. Patent No. 5,538,154 entitled Snap-On Flexible Lid

discloses a plastic lid with a peripheral flange constructed to enhance the "drop strength" of the

lid while retaining flexibility adequate to permit removal of the lid from a container. Drop

strength relates to the function or characteristic of the lid to maintain attachment to a container

even when dropped from various heights. Von Holdt in U.S. Patent No. 5,437,386 entitled

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

Container with Tamper-Evident Lid Removal Means discloses additional embodiments of

compatible molded plastic bucket and lid constructions.

Attachment of a lid to the open end of a molded plastic bucket often involves frictional or

interference engagement or interaction between a rib, lip or groove molded in the open end of the

bucket and a circumferential flange projection or groove in the lid. For example, the lid may

include a radially, inwardly extending flange, rib or lip that is engaged with an outwardly

extending rib on the outside wall of the bucket. A typical prior art lid and bucket combination is

depicted in the cross section in Figure 1. A bucket side wall 10 includes two circumferential,

outwardly extending radial ribs 12, 14 which are each cooperative with a separate, inwardly

extending circumferential, radial flange, 18, 20 on a skirt 13 of the lid 11. Flanges 18, 20 fit over

the bucket ribs 12, 14 and thereby hold or retain the lid 11 on the bucket. The flanges 18, 20

resist release or removal of the lid 11 from the top or open end of the bucket.

Such prior art constructions work well. However, the need for a tamper resistant,

improved lid construction for use in combination with a molded plastic bucket has remained.

SUMMARY OF THE INVENTION

In a principal aspect, the present invention comprises a molded plastic bucket or

container and a compatible lid combination wherein the bucket includes at least two, radially

outwardly extending, generally horizontal flanges or ribs at the top or open end of the bucket,

and wherein the lid includes a depending skirt with at least two inwardly extending flanges or

ribs that cooperate with the bucket ribs by engaging the bucket ribs. In this manner, the lid is

held by cooperative engagement of the lid flanges with the bucket ribs. Further, the lid includes

a downwardly extending, circumferential tongue adapted to fit in a circumferential groove in the

top edge of the bucket. The profile of the inside of the depending skirt of the lid is shaped to

thwart tampering with the seal of the lid on the container. A removable tear seal is also

incorporated in skirt of the lid. The tear seal has a zigzag shape which enables removal of

portions of the lower lid flange when the seal is removed.

Thus it is an object of the invention to provide an improved molded plastic bucket and lid

combination.

A further object of the invention is to provide a molded plastic bucket with outwardly

projecting lid retention ribs at the open end of the bucket and a lid with inwardly extending ribs

or flanges that hook over the bucket ribs to thereby effect sealing and retention of the lid on the

bucket.

Another object of the invention is to provide a bucket design and lid construction which

is tamper resistant and which can be made from molded plastic.

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

Another object of the invention is to provide a molded plastic bucket and lid wherein

multiple buckets each closed by a lid may be easily stacked.

A further object of the invention is to provide a combination molded plastic bucket and

separable lid wherein the lid includes an improved seal.

Another object of the invention is to provide a combination plastic bucket and lid which

incorporates multiple points of contact to effect a seal between the open end of the bucket and

the lid.

A further object of the invention is to provide a bucket and lid made from molded plastic

which is economical to manufacture, may be made for a reasonable cost of materials, and which

has necessary structural integrity and strength, including hoop strength, stacking strength and

drop strength.

These and other objects, advantages and features of the invention are set forth in the

detailed description which follows.

Attorney Docket No. 10778.00017

BRIEF DESCRIPTION OF THE DRAWING

In the detailed description which follows, reference will be made to the drawing, comprised of the following figures:

Figure 1 is a cross sectional view of a typical prior art lid construction for a molded plastic bucket;

Figure 2 is a cross sectional view of a first embodiment of the lid and bucket construction of the present invention;

Figure 3 is an isometric view of the embodiment of the lid and bucket construction of the invention as depicted in Figure 2 illustrating the attachment of the lid to the bucket;

Figure 4 is an enlarged isometric view of the security release strip associated with the lid of the embodiment of Figure 2;

Figure 5 is an exploded, isometric view of the embodiment of Figure 2;

Figure 6 is a cross sectional view of an alternative embodiment of the invention depicting the manner of stacking multiple unfilled containers or buckets.

Figure 7 is a cross sectional view of the bucket of Figure 6 with a compatible lid;

Figure 8 is an enlarged partial cross sectional view of the lid and bucket construction of Figure 7;

Figure 9 is partial side elevation of the lid of the embodiment of Figure 7 illustrating the lid tear strip;

Figure 10 is a partial side elevation of the lid of the embodiment of Figure 7 illustrating an end of the lid tear strip; and

DESCRIPTION OF THE PREFERRED EMBODIMENT

Figure 1 illustrates a typical prior art lid 11 and bucket or container 16. The lid 11

includes a depending flange or skirt 13 with radially inwardly extending ribs or flanges 18, 20

that cooperate with radially outwardly extending ribs 12, 14 associated with the top or open end

17 of the side wall 10 of bucket 16. Rib 12 is at the extreme upper, open end 17 of the bucket 16

and has a generally rectangular cross section. Rib 12 extends around the entire circumference of

the bucket, pail, or container 16. Similarly, the lower rib 14 extends around the circumference of

bucket side wall 10 of bucket 16.

The ribs 12 and 14 are vertically spaced from one another and preferably are continuous

with a uniform cross section about the circumference of the bucket 16. The inwardly extending,

locking ribs or flanges 18 and 20 of the lid 11 are similarly spaced and engage respectively under

the bucket ribs 12 and 14 to hold the lid 11 tightly on bucket 16. An optional flexible gasket 22

may be provided to seal the bottom of lid 10 against upper surface 21 of the outwardly radially

extending rib 12 of bucket 16. The container 16 and lid 11 are fabricated from molded plastic

material.

Figures 2-5 depict a first embodiment of an improved lid 26 and a compatible bucket, pail

or container 44. Referring to those figures, lid 26 includes a recessed central panel or section 28

which connects with an upwardly extending, vertical wall or hoop 30 that extends around the

circumference of the central section 28. The hoop 30 is integrally connected to a radially

outwardly extending annular, planar section 32. The annular section 32 further connects with an

upwardly and outwardly extending, inclined wall or hoop section 34 which, in turn, connects

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

with a radially outwardly extending annular planar section 36, connected to a downwardly

extending skirt 38 described in greater detail below.

Upwardly and downwardly extending vertical reinforcing fillets 31, 33 respectively are

optionally provided at spaced intervals about the periphery of section 32. Fillets 31, 33 function

to stiffen the lid 26 including the hoops 30, 34. The lid 26 further includes a downwardly

extending, internal lip or flange 40 which projects vertically downwardly from hoop 34 and is

parallel to and spaced outwardly from the hoop 30 so that flange 40 will fit against the inside

side surface 45 of bucket side wall 46. The flange 40 thus defines another hoop and further

functions as an inside lid seal. The flange 40 is, in cross section, in the form of a wedge with a

narrow portion of the wedge at the lower end 42 of the flange 40. This shape facilitates sealing

of and positioning of the lid 10 onto container or bucket 44 since flange 40 is wedged into

engagement with the inside surface 45 of vertical, bucket side wall 46 at the upper end or open

end of the bucket 44. The flange 40 is flexible or elastic to promote sealing. Fillets 33 spaced

about the circumference of flange 40 insure the flange 40 will be biased toward the wall 46 to

effect a seal on surface 45.

The bucket 44 includes an upper, circumferential, outwardly extending, horizontal rib 50.

Horizontal top surface 51 of the rib 50 includes a groove or channel 52 for receipt of a

downwardly extending tongue or wedge seal 48 of lid 26. In the preferred embodiment, the

channel 52 and the seal 48 are fully circumferential. However, other configurations are possible

so long as the seal 48 and channel 52 are compatible and provide a sealing function. The radial

or horizontal spacing of seal 48 and flange 40 is chosen to enhance a sealing and wedging,

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

grasping or gripping function of the lid 26 onto the bucket 44. An alternative to the seal 48 and

groove 52 comprises a compressible seal (not shown) fitted against the top surface 51 of rib 50

similar to the seal of Figure 1.

The upper rib 50 includes a circumferential, inwardly extending, lower land 54 which

acts as a contact surface for a portion of the lid 26 as described below. Spaced vertically

downwardly from the radially extending rib 50 on the outside of the bucket side wall 46 is a

second circumferential rib 56 which includes a lower, horizontal land 57. As an optional feature,

a third generally radial, outwardly extending rib 58 projects from the outside of the bucket side

wall 46 for further cooperation with the lid 26. Rib 58 includes an inclined upper land 63.

The lid 26 includes a first inwardly extending locking rib or flange 60 attached to the

downwardly extending, outer skirt 38. The locking flange 60 includes a surface 61 which

engages against the lower land 54 of bucket rib 50 to tightly retain the lid 10 in position on

bucket 44.

The skirt 38 further includes a second, inwardly extending flange 62 which provides a

first, latching surface 64 and a second, inwardly inclined face 66. The face 66 extends over a top

land or surface 59 of the bucket rib 56. It is noted that the locking flanges 60 and 62 engage

respectively with parallel, spaced surfaces 54, 57 of the radially outwardly extending ribs 50, 56

at the mouth of the bucket 44. Thus, the lid flanges 60 and 62 are, in essence, wedged against

the ribs 50 and 56 respectively as a result of their spacing and configuration.

A further feature comprises a third inwardly extending rib or flange 68 of lid 26 attached

to bottom of the skirt 38. Flange 68 extends inwardly to engage against or be positioned adjacent

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

the top surface 63 of the radially outwardly and downwardly extending rib 58 of the bucket 44.

The flange 68 is preferably connected to the skirt 38 along a zigzag tear strip boundary 70 so that

a tab 69 molded to provide a free end of flange 68 may be gripped and a tear strip, defined by rib

68 and portions of rib 62, may be removed or torn away from the skirt 38 to enable the lid 26 to

be removed from the bucket 44. As depicted in Figures 3-5, the tear strip incorporates the rib or

flange 68 as well as portions of rib or flange 62. Removal of the tear strip releases the holding

force associated with those portions of flange 62 that have been removed. The described

configuration therefore facilitates ease of removal as well as replacement of a lid 26 on an open

container 44. Also, if flange 68 is subjected to undesired tampering, the flange 68 will tear along

a boundary 70 and thus tampering may be evidenced.

In review, the optional wedge seal 48 that fits in the channel 52 enhances sealing of the

lid 26 to the bucket 44. Additionally, the downwardly extending flange 40 serves to seal the lid

26 to the bucket 44. The bridging planar radial section 36 connecting the flange 40 and skirt 38

is elastic and deformable so as to enable the skirt 38 to be deformed to permit removal of the lid

26. The inwardly extending flanges 60, 62 and 68 are defined by angled surfaces which facilitate

the movement or attachment of the lid 26 by virtue of a snap action wherein the flange or skirt 38

will deform elastically and then snap the various flanges 60, 62 into position to appropriately

engage ribs 50,56 of the bucket and wedge the lid 26 against the top of the bucket 44. The

angled walls (e.g., face 66 of flange 62) defining the flanges 60, 62 further facilitate the removal

and subsequent replacement of the lid 26 after the tear strip has been removed. Face 65 below

flange 60 has a similar function.

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

As depicted in the drawing, the lid 26 includes a recessed central section or panel 28.

This panel 28 enables buckets 44 to be stacked one upon the other inasmuch as the side wall 46

of each bucket 44 has, or may have, a draft angle and thus the lower end of the bucket 44 is sized

to fit on top of the lid 26 in the area defined by the central section or panel 28.

With the lid construction of the present invention, the wedging and locking functions

associated with the design of the edge or skirt of the lid 26 provide an improved and more

permanent seal of the lid 26 to the bucket. The use of two inwardly extending flanges to provide

a wedging and locking function is preferred along with a zig-zag tear seal which permits removal

of part of flange 62. However, it is possible to vary the number of lid flanges and bucket ribs,

and to vary positioning of the ribs vertically along the side of a bucket wall in combination with

inwardly extending flanges shaped in various configurations and tear strips associated with the

lid 26. The sealing channel 52 in the bucket top also may be varied. That is, the channel 52 in

bucket 44, which cooperates with the downwardly depending circumferential rib 48 of the lid,

may be replaced by a gasket seal of some type, for example. Also, the ribs and flanges are

described as continuous, but may be discontinuous. The zig-zag tear seal may also vary in

configuration and include one or more flanges 60, 62, 68.

Referring next to Figures 6-11, there is illustrated an alternative embodiment of the lid

and bucket construction of the invention. A bucket 74 includes a sidewall 76 which is made

from molded plastic material and defines a generally frustoconical section about a vertical axis

78. The bucket sidewall 76 extends from the bottom 80 of the bucket upwardly and terminates

with the open top 82.

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

The open top 82 includes a circumferential, first upper rib 84 with a depending groove 86

in the top surface thereof. Spaced from rib 84 is a second rib 86 which extends about the outside

circumference of the wall 76.

Positioned below the flange or rib 88 is a depending skirt 90 having an outwardly and

vertically downwardly inclined face 92, a generally vertical wall 94 and a connecting inwardly

extending molded land or planar section 96 connected to the wall 76. The molded wall 76 in

combination with the skirt 90 functions to provide enhanced hoop strength to the container 74.

As depicted in Figures 7 and 8, the upper end 82 of the side wall 76 is designed to be

used in combination with a lid 96. The lid 96 includes a center circular panel or section 98

which is connected by an inclined annular section 100 to a generally horizontal annular section

102. The annular section 102 connects to a downwardly depending inner circumferential flange

104 and upwardly extending inclined outward extending hoop 106. The hoop 106 further

connects with an annular planar section 108 which extends generally horizontally outwardly and

perpendicular to the axis 78 when the bucket is in the configuration or orientation depicted in

Figure 6. The annular section 108 includes a downwardly extending tongue seal 110 which fits

into the recessed groove 86.

The lid of 96 further includes a depending skirt 112 spaced from the flange 104 and

extending downwardly from annular section 108. The skirt 112 includes a first, circumferential,

inwardly extending flange 114 having a flange surface 116 which engages against the underside

of the rib 84. The skirt 112 further includes a second circumferential inwardly extending rib

member or flange 118 which cooperates with the bucket rib 88 by engaging the underside

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

thereof. The skirt 112 further includes a downwardly depending section or extension or strip 120

which is connected to the skirt 112 along a junction 122 to define a zigzag tear strip 120 as

depicted in greater detail in Figures 9 and 10. As shown in Figures 9 and 10, the tear strip 120

has a zigzag pattern and incorporates portions or circumferentially spaced segments of the flange

118. Thus, the flange 118 is defined by a series of connected segments such as 118A and 118B

in Figures 9 and 10. The segments 118A and 118B of the flange 118 are separated by a thin

molded portion in the skirt 112 so as to enable removal of the tear strip 120 by gripping or

pulling end tab 124 to thereby remove those rib sections 118B maintained on the tear strip 120.

The embodiment of Figures 6 through 11 functions in a manner similar to that of the

embodiment of Figures 2 - 5. That is the inwardly extending flanges 118 of the lid 96 cooperate

with outwardly extending ribs 88 of the bucket 74. A zig- zag tear strip is provided which, when

removed, eliminates a portion of the locking effect provided by the lower inwardly extending

flange 118. Thus, the combination includes a zig- zag tear strip and a double locking flange and

rib configuration. The combination may further include a downwardly extending tongue 110 of

a lid 96 which cooperates with a groove in the top of the bucket. Enhanced hoop strength is

provided by the configuration of the elements comprising the lid as well as the elements

comprising the open end of the container or bucket. The lid incorporates an arrangement of

circular spaced hoops which may be elastically deformed to effect engagement and locking with

the open end of the container or bucket. The various hoops provide hoop strength yet also permit

appropriate deformation for removal and replacement of the lid.

Attorney Docket No. 10778.00017

Banner & Witcoff, Ltd. Ten South Wacker Drive Chicago, Illinois 60606 (312) 463-5000 247262

Various other combinations of ribs, flanges, tear strips, and other elements as described may be utilized without departing from the spirit and scope of the invention. Thus, while there has been set forth preferred embodiments of the invention, it is to be understood that the invention is to be limited only by the following claims and equivalents thereof.
